Hiring Manager
MDA Space
Richmond, BC

Dear Hiring Manager,

I am writing to apply for the Systems Engineering Co-op Space Missions position at MDA Space for Summer 2025. I am currently a third year Software Engineering student at Thompson Rivers University with a deep passion for space since my childhood as well as a solid foundation in programming, system level problem solving, and hands-on project work.

My passion for space has been fueled by the dobsonian telescope I got as a graduation gift, as well as my astrophotography setup I built up over the years as a teenager. My original plan was to major in something like astrophysics, but a flip of a coin told me to go for software engineering instead. I would love to have the opportunity to combine both passions into one job.

During my studies, I have tackled challenging projects such as developing an FPGA based calculator and integrating subscription management into a mobile app. These experiences required me to analyze complex requirements, debug hardware and software issues, and adapt quickly to new tools and technologies. I have strong working knowledge of MS Excel and MS Office from the physics labs, and I am proficient in Python and other scripting languages, which I believe will serve well in performing technical analyses and developing system models.

I am available for an eight month co-op term and look forward to contributing my technical skills and practical problem solving experience to the CHORUS program and other projects at MDA Space. Thank you for your consideration, and I look forward to the possibility of discussing my application further.

Sincerely,

Bradley D. Schmidt
